The Power of our Focus Plugins

Our range of Focus Plugins represent a significant step forward in analysis technology and allow coaches and support staff to view and measure performance in a more integrated and comprehensive way than ever before.

The unique Focus Plugin technology combines the powerful performance and technique analysis tools of our other Focus products, with the ability to link with, and import data from, other data sources.

It has been designed to integrate all aspects of sports science support with the powerful analysis tools built into all Focus programmes.

How does our Focus Plugin technology work?

Step 1

Video the performance and carry out your analysis of the performance using your Focus software

Step 2

Gather any other data that you require during the performance (e.g. Polar HR or GPS data)

Step 3

Run the appropriate Focus Plug-in to upload your external data file(s) into Focus and automatically synch this with the video.

Step 4

View the data and video interactively using the Focus Plus multi-variable facility.

A selection of our Focus Plugins

Focus Heart-Rate Plugin

This plug-in allows Individual and Team Polar HR data to be uploaded into Focus. It is then automatically synchronised with the video footage and displayed on-screen. This allows you to watch the video performance of the game and view any player's heart-rate in the Focus screen at any point – enabling you to view the data in context.

VO2 Max Data Plugin

By synchronising the VO2 Max and other Gas Analysis data with video footage, this Focus plugin provides the unique ability to view the data in the context of its impact on technique.

SRM Data Plugin

This plug-in provides support staff and coaches with the crucial ability to assess how slight changes and refinements in technique are directly impacting on the data being generated.

GPS Data

The ability to integrate GPS related data into Focus and then synchronising this with the video footage enables crucial positioning, distance and speed information etc. to be viewed in the visual context of the performance.
